An Equation

This is a slide with a grainy background.
There is only one box type, sketchybox. Here it is.

The Riemann Zeta Function

$$\zeta(s) = \sum_{n \geq 1} \frac{1}{n^s}$$

for $\Re(s) > 1$.

Multiple sketchyboxes

The slides and sketchyboxes also get different backgrounds, to avoid repetition.

Continuing Zeta Analytically

$$\zeta(s) = \frac{1}{s-1} + 1 - s\int_1^\infty \frac{t - \lfloor t \rfloor}{t^{s+1}}\,dt$$

for $\Re(s) > 0$, $s \neq 1$.

The Completed Zeta Function

$$\xi(s) := s(s-1)\pi^{-s/2}\Gamma\left(\tfrac{s}{2}\right)\zeta(s) = \xi(1-s)$$

is entire.

Seeing All the Variations in sketchybox

The background grain is taken from one of six images. Let us cycle through to see all the possibilities.

Euler Product Formula $\Re(s) > 1$

$$\zeta(s) = \prod_{p \text{ prime}} \left(1 - p^{-s}\right)^{-1}.$$

Zeros of Zeta

The zeros of zeta with $0 < \Re(s) < 1$ are the *critical* zeros. The *Riemann Hypothesis* is the unproven claim that all the critical zeros of ζ lie on the line $\Re(s) = 1/2$.

The Last sketchybox Frame

The Prime Number Theorem

Let $\pi(x)$ denote the prime-counting function, which gives the number of primes less than or equal to a real number x. As $x \to \infty$, we have the asymptotic relation:

$$\pi(x) \sim \frac{x}{\ln(x)}$$

Equivalently, the limit of the quotient is given by:

$$\lim_{x \to \infty} \frac{\pi(x)}{x/\ln(x)} = 1.$$

Yet Another Slide

This is another slide with a different grainy background. This slide also has a list.

1. The numbers have the same color as the title.
2. Note that some backgrounds require less opacity

The Penultimate Slide

There are 5 different pre-loaded backgrounds. I've experimented with textures from chalkboards, metals, or fabric textures, but the best results come from vintage paper.
You have to be somewhat careful with the opacity, since the textures come with their own color data that can mess with your slide's background colors.

Thank you!
